2021-2025 Capital Plan

Glossary of Acronyms & Terms

The following is a listing of acronyms and terms used in the Capital Plan Summary and Project Detail Sheets.

LCA Water and/or Wastewater Divisions/Systems

	LCA Water and/or Wastewater Division	ns/Systems	
		Water	Wastewater
AD	Allentown Division	Х	Х
AWD	Arcadia West Division	X	X
BHD	Beverly Hills Division	X	
CLD	Central Lehigh Division	X	
CFD	Clear View Farms Division	X	
ECD	Emmaus Consecutive Division	X	
HHD	Heidelberg Heights Division	Х	Х
LLRI-1	Little Lehigh Relief Interceptor, Phase 1		Х
LLRI-2	Little Lehigh Relief Interceptor, Phase 2		Х
LTD	Lynn Township Division		Х
MCD	Mill Creek Division	Х	
MND	Madison Park Division	Х	
NWD	North Whitehall Division	Х	
PLD	Pine Lakes Division	Х	
SSD	Sands Spring Division		Х
UMD	Upper Milford Division	Х	Х
UMCD	Upper Central Milford Division (Buss Acres)	Х	
WLI	Western Lehigh Interceptor		Х
WTD	Washington Township Division	Х	Х
WWD	Wynnewood Division		Х

Project Type

Project Type	Description
AO	Prior Administrative Order/Current Regional Flow Management Strategy
UW	Uncompleted Work ⁽¹⁾
S-7-MCI	Schedule-7 (Lease Required) Major Capital Improvement ⁽²⁾
LCA-MCI	LCA Developed Major Capital Improvement ⁽²⁾
COL	Change of Law ⁽³⁾
Regular	A project that does not fit in any of the aforementioned special categories

- (1) Uncompleted Work: City Projects that were supposed to be complete by the time of settlement. The City and LCA have reached an agreement for LCA to execute them.
- (2) Major Capital Improvement: In accordance with the Lease, all Major Capital Improvements must be approved by the City.
- (3) Change of Law: In accordance with the Change of Law Memorandum of Understanding

Project Funding

Project Funding	Description
LCA	Funded by LCA
100% Reimb	All costs are 100% reimbursable by fees charged
Fees & LCA	Costs partly recovered through fees charged and partly funded by LCA
Allentown	Funded by the City of Allentown
CCRC	Capital Cost Recovery Charge ⁽¹⁾ ; Applies only to City approved MCI

(1) Capital Cost Recovery Charge: An on-going user fee that is above the rate caps set forth in the Lease to allow the recovery of the cost of an MCI. Rate payers are charged based upon usage.

Project Category

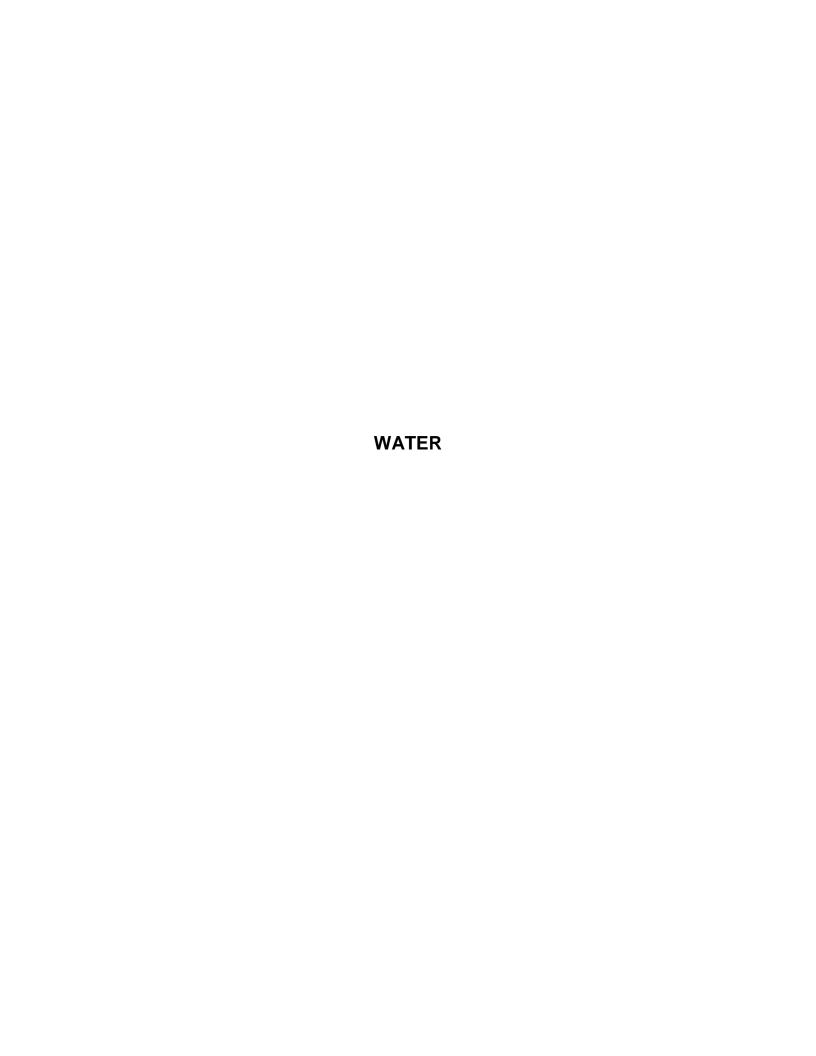

Projects have been categorized to identify the primary and secondary reasons for the need. In some cases there is no secondary reason that would be applicable.

Project Category	Description
Regulatory	Required to meet Regulatory requirements
New Cust	New Customers
CA/OS	Concession Lease/Operating Standards
Master Plan	Master Plan
AM - Low	Asset Management - Low Risk
AM - Med	Asset Management - Medium Risk
AM - High	Asset Management - High Risk
AM - Varies	Asset Management - Varies ⁽¹⁾
Efficiency	Efficiency
Sys Imp	System Improvement
Rev Opprt	Revenue Opportunity
Planning	Planning
N/A	Not Applicable

(1) Applies to Asset Management Projects, where there are multiple standalone sub-projects of varied levels of "risk".

Approval Stage

Approval Stage	Description
Α	Annual Project, no approvals required
S	Study/Planning Phase
D	Design Phase
С	Construction/Implementation Phase
Ε	Entire Project
V	Various Phases
Р	Pending Board approval

LEHIGH COUNTY AUTHORITY SUBURBAN DIVISION WATER 5-YEAR CAPITAL PLAN 2021–2025

CAPITAL FINANCING JUSTIFICATION

Capital additions to the Water System are justified by using six revenue sources: user charges, assessments or distribution tapping fees, supply tapping fees, contributions-in-aid of construction, reimbursements from the wastewater funds and grants. This would comprise the amount of cash available from operations for capital projects.

Beyond the operating cash available, remaining sources are project reserves from previous debt issuance and any new borrowing required.

The table below summarizes the capital project sourcing by year and each major financial sourcing category:

CAPITAL FINANCING SOURCES										
	2021	2022	2023	2024	2025	TOTAL				
Project Costs	\$3,525,000	\$4,772,000	\$4,215,000	\$3,868,000	\$5,910,000	\$22,290,000				
Sources of Funding:										
Operating Reserves	\$390,019	\$987,116	\$1,440,803	\$1,943,753	\$2,511,176	\$7,272,867				
Capital Reserves	\$1,204,981	\$2,904,884	\$2,604,197	\$1,924,247	\$1,356,824	\$9,995,133				
New Borrowing \$1,930,000 \$880		\$880,000	\$170,000	\$0	\$2,042,000	\$5,022,000				
TOTAL FUNDING	\$3,525,000	\$4,772,000	\$4,215,000	\$3,868,000	\$5,910,000	\$22,290,000				

Total spending on capital projects for the five-year period totals \$22,290,000. Operating and capital reserves over the period will provide \$17,268,000 for capital projects. New borrowing in the amount of \$5,022,000 will provide the remaining funding required.

The \$5,022,000 borrowing is to fund non-annual projects. To support the additional debt service worth 273,053 annually on the \$5,022,000 borrowing and annual inflation on operating expenses, a revenue increase of 6.50% each year will be required.

CONDENSED CASH FLOW - SUBURBAN WATER

Detailed Project Description

This is an annual project that in prior years appeared as separate recurring projects. This annual project includes the following: New Water Main Installation, Distribution Mains - Development & Service Connections, Distribution Mains - Upsizing/Contribution, Reservoir Rehabilitation/Maintenance, Water Company Acquisitions, Main Office/Operations Center Improvements, Mobile Equipment, Other Equipment, General Water System Improvements, Water Facilities Asset Management Improvements and new and replacment water meters.

Project Drivers and Needs to be Met by the Project

The primary drivers for these projects are asset management, operational efficiency and revenue generation. Annual items help maintain the operation and adequate level of service of existing water supply, distribution, and support facilities in the Suburban Division, and accomodate water distribution needs of growth.

Project Status - Describe what work, if any has been completed or underway for this project

This is an annual project, therefore, work is on-going.

Varies by system - Main Replacements are located in multiple systems.

Detailed Project Description

Replacement of cast iron (CI) mains in water systems that are prioritized based on break history, geology (sinkholes), pipe condition, pipe age, and probability and consequence of failure. Year 2 of the Capital Plan (CP) (2021) will replace an approximate one-mile of main that, to date, has experienced a high rate of failure. Annual funding is provided on a prioritized as-needed basis for subsequent years in the CP - in the event that additional mains start to exhibit high failure rates, thereby justifying replacement.

Project Drivers and Needs to be Met by the Project

Replacing CI mains will reduce the frequency of breaks in the system thereby saving the Authority repair costs, customer outages and reducing the potential for damage which can occur to private property.

Project Status - Describe what work, if any has been completed or underway for this project

This is an annual project, therefore, work is on-going.

Will the Project Require Obtaining Land Rights	TBD	Anticipated Project completion date	2020	

Detailed Project Description

The project includes the replacement of two existing aged problematic hydro-pneumatic operated well stations in need of mechanical, structural, HVAC and electrical repairs. The pressurized 6,000 gallon water storage tanks at both facilities have exceeded their useful life and are not in compliance with regulatory requirements for pressure vessels. The project involves the consolidation of both stations on the largest existing well station parcel with a single new well/pump station and a new, larger water storage tank. The new station will be a variable frequency drive-controlled double pumping system with full SCADA telemetry/control. In addition, given the water supply has a high level of radon (currently there is no regulatory limit), design provisions will be incorporated to facilitate the future addition of radon mitigation equipment conditioned on the establishment of a regulatory limit.

Project Drivers and Needs to be Met by the Project

Both the Gary and Laurie hydropneumatic tanks have exceeded their useful life and are not in compliance with regulatory requirements for pressure vessels. In addition, both well house facilities were evaluated as part of the 2016 Asset Evaluation Study and numerous deficiencies were identified. Provisions were incorporated into the design to reduce the radon levels in the water by approximately 70%. Additionally, the design will accommodate the future addition of radon mitigation equipment if a regulatory radon limit is established.

Project Status - Describe what work, if any has been completed or underway for this project

Radon Evaluation and Mitigation Study done in April 2013. Asset Evaluation Study done in 2016. Design was completed in 2019 and construction will occur in 2020.

Annual Cost Impact							
Operating - Increase/(Decrease)		N/A					
Debt Service	\$		-				
Net	\$		-				

Borrowing	g Information
Interest Rate	5.5000%
Term (Years)	30

Revenue Impact				
Gain/(Loss) in Annual Revenue	N/A			
Assessment, Contribution	N/A			
in Aid-of-Construction	N/A			
Other				

Explanation if Necessary

Electrical power costs will increase because of the conversion from the hydro-pneumatic to a double pumping system. If radon mitigation equipment is installed in the future, operating costs will increase again because of added electrical power needs and maintenance. Exact costs to be determined.

Detailed Project Description

This project addresses the development of an additional well as a secondary water source. DEP regulations for new public water systems now require a backup or redundant source of supply. This was a developer system that was built prior to these regulations and acquired by LCA. The project includes the drilling of a well on private property adjacent to the Madison Park North subdivision, construction of a well house and piping to the existing treatment building.

Project Drivers and Needs to be Met by the Project

The Madison Park North water system is currently operating on one well and does not have a redundant water supply. The consequence of failure for the single well serving this satellite system is significant, as water storage for this system is approximately equal to two days average day demand and fire protection would not be available.

Project Status - Describe what work, if any has been completed or underway for this project

The property owner identified for the Madison Park North (MPN) backup well site executed a temporary easement agreement in 2018 to allow the development of an exploratory well on the property. An exploratory well was drilled in late 2018 and, based on the yield and water quality data, a permanent well will be developed on this site. Development of a permanent backup well for MPN is assumed to commence in 2020.

Detailed Project Description

The project consists of a water booster pumping station with (3) 500 GPM pumps, (1) 2,500 GPM high service pump, generator and approximately 1,750 linear-feet of 12-inch diameter main extending from the intersection of Cetronia Road and Werley Road north along Werley Road and connecting to the existing main in Laurel Field in Upper Macungie Township. The pumping station will be located on a small permanent easement yet to be obtained. SCADA will be included in the project.

Project Drivers and Needs to be Met by the Project

The CLD system is divided into two primary gravity service elevations: the Upper System (US) and the Lower System (LS). Currently water can be transferred down from the US to the LS, but there are no facilities that can pump water from the LS to the US. The proposed auxiliary pumping station will provide added reliability and a higher level of service to the US. In addition, it will provide flexibility for utilizing water purchased from the City of Allentown.

Project Status - Describe what work, if any has been completed or underway for this project

The public water supply construction permit was issued by DEP. Bids for the general and electrical contracts were opened via the PennBid system on June 29, 2018. Construction was substantially completed in 2019.

Detailed Project Description

Development of a fixed base system for meter reading. A communication study by Sensus to evaluate the number and location of antenna towers for Suburban area coverage was performed in 2019 and revisions to that study will be completed in 2020. Five antennas are anticipated in order to provide adequate coverage of the Suburban system.

Project Drivers and Needs to be Met by the Project

The new system will allow for more efficient meter reading, consistent billing and faster dispute resolution. As meters are upgraded, the AMI system will allow us to monitor customer usage in real time and proactively address problems.

Project Status - Describe what work, if any has been completed or underway for this project

The radio transceiver units were upgraded in 2019/2020 and are now compatible with an AMI system.

Will the Project Require Obtaining Land Rights	No	Anticipated Project completion date	TBD	

Detailed Project Description

The first phase of this project consists of an engineering study to commence in 2020 to identify improvements in system reliability. The assumption is that an improvements plan will be prepared that may include interconnection with surrounding water systems, including a second interconnection with the NBMA water system. Most of the supply for the existing system is from the NBMA interconnection, and a critical main serves the southern portion of the system. Installation of a storage tank that would float on the system and looping of dead end lines may be identified as a study recommendation, along with identifying sources of high unaccounted-for water. The scope and cost of an improvements project is not known at this time.

Project Drivers and Needs to be Met by the Project

Inadequate looping of the distribution system affects system reliability and water quality, and will drive the need for modifications. LCA's objective is to be proactive and identify capital improvements required in order to adequately serve current and future customers.

Project Status - Describe what work, if any has been completed or underway for this project

The Phase 1 assessment study will be performed in 2020. The improvements project will be kicked off in 2021; however, the scope of this effort is undefined at this time.

Detailed Project Description

The water tank at Arcadia West has developed numerous leaks and the interior and exterior coating systems have reached the end of their useful life. An engineering evaluation was done in 2019 to determine the best course of action for the future of the tank. The recommended option is to construct a new concrete tank adjacent to the existing tank, which would then be demolished. This will allow for continued water service and fire protection during construction.

Project Drivers and Needs to be Met by the Project

The tank is the only water storage facility and provides fire protection to the industrial customers in the Arcadia West system. The consequence of failure would be significant.

Project Status - Describe what work, if any has been completed or underway for this project

Is this System part of a Common User Rate? Yes		Anticipated Project completion date				
Will the Project Require Obtaining Land Rights	No	Anticipated Project completion date	2020			

Detailed Project Description

The Project includes the replacement of 20,000 transceiver units. 10,000 units will be replaced in 2019 and the remaining will be replaced in 2020. Approximately 1,000 transceiver units no longer work, and more continue to fail as they reach the end of their useful life. The new units have a longer (20 year) battery life and are compatible with the new meter reading software purchased in 2017. This project will replace approximately 100% of the remaining old style radio units over a two year period. Moving forward, implementation of a fixed base meter reading system is anticipated.

Project Drivers and Needs to be Met by the Project

Non-working transceiver units result in estimated water bills, potentially decreasing revenues. Secondly, the new radio read technology will increase meter reading accuracy and efficiency that will allow operators to focus efforts in more technical areas, and will allow for easier conversion to monthly billing in the future.

Project Status - Describe what work, if any has been completed or underway for this project

The construction of the 2018 Water Meter Replacement project included the installation of approximately 3,100 new radio units. This project began in 2019. A change order was approved to continue the radio replacements that were scheduled for 2020. The project is expected to be completed in the first quarter of 2020.

Includes 72 existing customers in Mink Estates and Far View Farms plus 123 new customers in the Kohler Tract.

Detailed Project Description

The project consists of a 3-pump 0.5 MGD water booster pumping station with chlorine feed, generator and high service pump. A 12-inch diameter main will be constructed by the developer to interconnect the pump station and the Kohler Tract. The pumping station will be located on a tract acquired along Chestnut Street. SCADA will be included in the project. LCA contribution to the interconnecting main that will be constructed by the developer of the Kohler Tract will be paid out of Distribution Mains-Upsizing/Contribution.

Project Drivers and Needs to be Met by the Project

The proposed pumping station will provide service to the Kohler Tract, as well as a higher level of service to existing customers in Mink Estates and Far View Farms. An additional 80 customers in the Emmaus Consecutive System that abut the Kohler Tract could be supplied if deemed beneficial.

Project Status - Describe what work, if any has been completed or underway for this project

The public water supply construction permit was issued by DEP in 2018. The pump station site and permanent offsite water line easements have been acquired. Pumping station bids were opened on 4/25/19. Board approval for the construction phase of the project was granted at the 5/13/19 meeting. A preconstruction meeting was held on 6/25/19. Construction should be completed by September of 2020.

Detailed Project Description

This project consists of a detailed engineering evaluation of three large producing wells in the CLD system that are currently not being used because of water quality issues. Well 3 has a capacity of 1000 GPM but has high levels of manganese. Well 2 has a capacity of 200 GPM but must maintain a high chlorine residual to meet contact time. Well 12 has a capacity of 700 GPM but has high turbidity levels. An engineering study will be performed to determine upgrade options/costs to restore the wells to full service. The study will determine the value of having the wells as sources. The assumption is that a well station upgrade project(s) will be recommended in the study phase, which will result in conceptual design within the capital planning window of a to-be-determined upgrade.

Project Drivers and Needs to be Met by the Project

The wells, if rehabilitated/upgraded, could be used as additional sources to supplement flow should water demand increase due to development in the Western Lehigh service area or a potential large industrial user. The study will provide information which will allow us to prioritize and budget for the addition of the wells as sources of supply.

Project Status - Describe what work, if any has been completed or underway for this project

An engineering consultant was selected and work on the study began in 2019.

Detailed Project Description

The first phase of this project consists of an engineering study to be completed in 2020 to evaluate future water demand scenarios and engineering alternatives for system improvements in order to provide adequate water supply and pressure to future customers which would include potential large users in the CLD system. This second phase of the project (scope unknown at this time) will implement the selected improvement alternative(s) to address the deficiencies identified in the feasibility evaluation that may include increasing well production and/or upsizing of water mains.

Project Drivers and Needs to be Met by the Project

Accommodation of potential large industrial water users and major residential/commercial developments in the CLD system will drive the need for modifications to the water supply and distribution system. LCA's objective is to be proactive and identify capital improvements required in order to provide adequate water service to meet future demands.

Project Status - Describe what work, if any has been completed or underway for this project

The Phase 1 study will be performed in 2020 (Cap Ex \$60,000). The improvements project will be kicked off in 2021. However, the scope of this effort is undefined at this time.

Detailed Project Description

The Project includes the replacement of \sim 139 each 1-1/2" and 2" water meters (2022) and 6,044 each 5/8" and 1" meters (2025) that have reached the end of their useful lives. All new meters will have radio-read (RR) capability.

Project Drivers and Needs to be Met by the Project

The probability of inaccuracies in meter readings increase with age and usage of the meters. The accuracy of the new meters should have the potential to increase user revenues. Secondly, RR technology will increase meter reading accuracy and efficiency that will allow operators to focus efforts in other critical technical areas.

Project Status - Describe what work, if any has been completed or underway for this project

Aging meters are periodically replaced as part of an on-going program.

Annual Cost Impact						
Operating - Increase/(Decrease)		N/A				
Debt Service	\$		-			
Net	\$		-			

Borrowing Information				
Interest Rate 5.5000%				
Term (Years)	30			

Revenue Impact					
Gain/(Loss) in Annual Revenue		\$	100,000		
Assessment, Contribution		N/A			
in Aid-of-Construction					
Other					

Explanation if Necessary

An increase in revenue is anticipated as older meters are replaced. This is due to wear on internal parts that generally causes lower measurements. A 5% increase was assumed in the revenue gain reported above.

LEHIGH COUNTY AUTHORITY SUBURBAN DIVISION WASTEWATER 5-YEAR CAPITAL PLAN 2021–2025

CAPITAL FINANCING JUSTIFICATION

Capital additions to the Wastewater System are justified by calculating the operating cash available based upon projections of revenues over the five year period. Beyond the operating cash available, remaining sources are project reserves from previous debt issuance and any new borrowing required.

The table below summarizes the capital project sourcing by year and each major financial sourcing category:

CAPITAL FINANCING SOURCES							
	2021	2022	2023	2024	2025	TOTAL	
Project Costs	\$4,003,500	\$4,675,500	\$8,494,500	\$10,157,500	\$2,007,500	\$29,338,500	
Sources of Funding:							
Operating Reserves	\$1,815,500	\$2,064,990	\$1,942,897	\$1,742,500	\$1,392,500	\$8,958,387	
Capital Reserves	-	\$500,510	\$761,603	-	1	\$1,262,113	
New Borrowing	\$2,188,000	\$2,110,000	\$5,790,000	\$8,415,000	\$615,000	\$19,118,000	
TOTAL FUNDING	\$4,003,500	\$4,675,500	\$8,494,500	\$10,157,500	\$2,007,500	\$29,338,500	

Total spending on capital projects for the five-year period totals \$29,338,500. Operating and capital reserves over the period will provide \$10,220,500 for capital projects. New borrowing in the amount of \$19,118,000 will provide the remaining funding required.

The \$19,118,000 of new borrowing will provide funding for Act 537 Sewage Facilities Plan projects in WLI group, along with funding projects for LCA's satellite systems. The annual debt service on that borrowing of \$1,404,683 annually will be collected from the signatories in the WLI group.

Revenue requirements will also be impacted by inflation for both the WLI group along with other users of the system. Revenue increases by year to support the capital plan are as follows:

Year 2021	0.0%
Year 2022	2.2%
Year 2023	2.4%
Year 2024	2.5%
Year 2025	2.6%

Provides pretreatment for industrial customers such as Boston Beer, Coca-Cola, Nestle Waters, Niagara, Ocean Spray, Bimbo and others.

Detailed Project Description

This capital project is a comprehensive on-going program to address the continued reliability and functionality of the LCA Wastewater Pretreatment Plant. Planned projects include waste hauler station piping modifications, anaerobic digester mechanical upgrades, security upgrades, belt filter press #1 and #4 rebuilds, air deck mixer replacements (multi-year), solids building HVAC system upgrade, primary clarifiers mechanical refurbish (multi-year), final clarifiers drive replacements (multi-year), annual pavement rehabilitation, cryogenic plant control center modernization, and miscellaneous mechanical and electrical upgrades/replacements.

Project Drivers and Needs to be Met by the Project

The primary project drivers are asset management and system improvements. This facility is critical to the local economy and growth in the Western Lehigh sewer service area. Capital improvements are needed annually to maintain the level of service for the pretreatment facility, which has been in continuous operation since 1990, with significant equipment exposed to corrosive &/or severe duty conditions. The increased industrial loading rates experienced since the plant was placed into service drives the need for repairs, replacements and process modifications/optimization. The Capital Plan intends to maintain the reliability, performance, and structural integrity of the physical plant while maintaining economic viability.

Project Status - Describe what work, if any has been completed or underway for this project

A semi-annual program to rebuild the belt filter presses was started in 2015. Annual pavement reconstruction projects are performed on the main access routes used by the waste hauler trucks within the plant site to replace failed and deteriorated asphalt pavement with concrete pavement. The SCADA system and grease station projects were completed in 2019. Replacement of the cryogenic plant "B-Mac" compressor was completed in 2019, along with other capital improvements to the cryogenic plant. In 2020 a project to modify the waste hauler station piping in order to prethicken the waste (prior to conveyance to the digesters) will be completed, along with mechanical upgrades of the 3 digesters, pavement rehabilitation, and influent pump station upgrade.

Will the Project Require Obtaining Land Rights	No	No Anticipated Project completion date 2032		

Detailed Project Description

Scope involves planning for additional treatment capacity for WLI service area and construction of selected alternative. This project is needed for future wastewater treatment capacity and covers either expanding the Kline's Island Wastewater Treatment Plant (KIWWTP) or converting the pretreatment plant to a full treatment facility, which includes discharge pumping and piping. Completion of the Act 537 Plan is set for 12/31/23 and construction of the yet to be selected option is assumed to be after this 5-year Capital Planning period.

Project Drivers and Needs to be Met by the Project

The City's Kline's Island WWTP does not currently have enough available wastewater treatment allocation to meet LCA's future needs. To meet wastewater treatment needs, the best available options must be investigated. Although some recovery of capacity will occur through inflow and infiltration removal, there is no wastewater allocation remaining for sale. Updating the 537 Plan is the primary cost factor for planning. Capital costs will be recovered through a combination of increased user fees and capital recovery fees to new customers. Risk of not doing this project include regulatory action against the region.

Project Status - Describe what work, if any has been completed or underway for this project

In 2013, ARRO, Inc. and AECOM were retained to prepare an Act 537 Plan (LCA focused, with City partner) to evaluate the alternatives for an additional 4 MGD of wastewater treatment capacity. The project was put on hold by DEP in 2015, with an emphasis on managing wet weather and removing I&I. In 2019, at the request of DEP, preliminary work on the Act 537 Plan (Regional) was restarted. The full Act 537 Plan (Regional) due is now due by 12/31/23. An Interim Act 537 Plan (Regional) is due by September 2020 that will inclue flow projections through 2025.

^{**=} The Spring Creek Pump Station & Force Main provides service to 7 WL signatories.

Detailed Project Description

Replacement of inoperable and/or badly corroded original air release or combination air/vacuum release valves (ARV's) on the existing Spring Creek Pump Station force main.

Project Drivers and Needs to be Met by the Project

Inoperable air release valves contribute to both poor hydraulics and wasted pump energy created by allowing air to either accumulate at high points along the force main, or to not provide proper vacuum release. Replacing the air valves should improve the pump station and force main performance. The odor control canisters at various ARVs will be replaced as part of construction.

Project Status - Describe what work, if any has been completed or underway for this project

Design work was completed in 2018. Project to be implemented as an annual upgrade with 2 or 3 ARVs replaced per year, starting in 2020.

^{**=} The Spring Creek Force Main provides service to 7 WL signatories.

Detailed Project Description

The Spring Creek force Main was installed in two phases. The first section was installed in 1995 and the second section was installed in 2004. A PURE SmartBall investigation will be performed to identify the location of gas pockets and leaks. A broadband electromagnetic (BEM) test will then be conducted at locations where gas pockets are found to determine remaining wall thickness and assess the remaining useful life of the force main before scoping a repair, rehabilitation, or replacement project. Pipeline rehabilitation is not included in this project as the scope of that work is not known at this time.

Project Drivers and Needs to be Met by the Project

Asset management is the primary driver for this project. The Spring Creek Pump Station and Force Main is an integral part of the Western Lehigh service area. It is essential to perform necessary rehabilitation of the force main to extend the service life of teh infrastructure, restore level of service, and mitigate the risk of a catastrophic failure.

Project Status - Describe what work, if any has been completed or underway for this project

Project will commence in 2021.

Detailed Project Description

In 2020, LCA anticipates to completing an updated CCTV inspection condition assessment, identifying problem areas, and implementing annual repair/remediation measures to eliminate excess wet weather flow into the sanitary sewer system. An initial remediation project to address problem areas and mitigate inflow and infiltration (I/I) will be designed and bid in-house, and is anticipated to begin in 2020.

Project Drivers and Needs to be Met by the Project

The primary drivers for the project are: maintain the level of service, avoid regulatory violations due to peak wet weather flows, and reduce system operation cost. During wet-weather events, excess flows create capacity problems at the wastewater treatment plant and drive operating costs higher. Removal of wet weather I/I will reduce treatment costs, avoid hydraulic overloads, and reclaim capacity for utilization by potential new customers.

Project Status - Describe what work, if any has been completed or underway for this project

The Test & Seal project was completed in Wynnewood at the end of 2016, however, wet weather flows remain a problem. An updated systemwide CCTV inspection condition assessment was substantially completed in 2019 that helped to identify problem areas and scope out necessary repairs. Capital plan cost is primarily to perform system spot repairs. Periodic CCTV inspection updates are required as a follow up in later years to track system condition and identify problems.

Detailed Project Description

The existing developer-built steel tank wastewater treatment plant is approximately 30 years-old and at the end of its useful life (as identified in a 2015 Condition Assessment study performed by an engineer). The project is for the construction of a new concrete tank 60,000 gallon per day sequencing batch reactor process facility starting in 2019. This is to be completed in 2020 (adjacent to the original plant location).

Project Drivers and Needs to be Met by the Project

Project will address the high risk rating of this facility and restore the level of service. It will also address mechanical equipment and structures that are in poor condition. With ever increasing environmental restrictions, it is inevitable that the performance of the aging facility will decline and result in DEP permit violations. Regulatory agency input was incorporated during design phase in order to meet future stricter discharge parameters for the new plant.

Project Status - Describe what work, if any has been completed or underway for this project

A Condition Assessment of the WWTP was conducted in 2015 and design of the replacement facility was finished in mid-2018. The project was bid in Q32018. Construction will finish in early 2020.

Serves Arcadia West Industrial Park, West Hills Business Center, NW Lehigh SD Elementary School.

Detailed Project Description

The project involves the design and installation of an automatic mechanical screen and associated components at the influent end (headworks) of the plant.

Project Drivers and Needs to be Met by the Project

The primary drivers for the project are: increased operational efficiency, system improvement and reduce operation costs. There is currently no means to automatically remove the inorganic debris (rags, plastics, etc.) from the facility's influent waste stream. This bulky material clogs pumps and periodically accumulates on and fouls downstream process equipment (such as pump floats, piping, and air diffusers). Removal of this material requires manual effort (often in difficult access locations) or complete tank draining (which increases operational costs). A mechanical screen will improve facility operation by removing the rags and other inorganic debris from the influent plant flow and may reduce operations cost.

Project Status - Describe what work, if any has been completed or underway for this project

An internal investigation was performed to determine if the comminutor performance can be optimized to decrease the debris accumulation. The preferred alternative to resolving the problem is a mechanical screen. The screen project will be designed in 2022 and constructed in 2022 and 2023.

Revenue Impact

Borrowing Information				
Interest Rate	5.5000%			
Term (Years)	30			

Explanation if Necessary

The mechanical screen will increase operational costs marginally mainly due to electrical power and debris disposal. However, the increase in operational costs will be offset by a decrease in staff costs associated with not having to remove rags and inorganic debris that currently are not screened from the waste stream and clog downstream pumps and accumulate on mechanical and instrumentation equipment. Exact costs to be determined.

^{**} Includes customers in the Weisenberg, Lowhill and Upper Milford systems.

Detailed Project Description

This project involves the preparation of a Sanitary Sewer Evaluation Study (SSES) to identify primary areas of concern and prioritize future sewer system improvements in the Weisenberg, Lowhill, and Upper Milford sanitary sewer systems. Components of the SSES may include manhole inspections, CCTV inspections, and flow monitoring. A remediation project to address problem areas and mitigate inflow and infiltration (I/I) will be part of a future project.

Project Drivers and Needs to be Met by the Project

The primary driver for this project is regulatory. These three systems ultimately tie in to the Western Lehigh Interceptor (WLI). Managing inflow and infiltration in these systems will in turn help manage flows in the WLI.

Project Status - Describe what work, if any has been completed or underway for this project

A Sanitary Sewer Evaluation Study was done for these systems in the early 2010s as part of the overall SCARP program. Information from this previous study will be used to help determine any increase in I&I.

Detailed Project Description

The existing developer-built steel tank wastewater treatment plant is approximately 45 years old and at the end of its useful life (as identified in a 2015 Condition Assessment study performed by a consultant). The project proposes a new concrete tank 35,000 GPD sequencing batch reactor process facility to be constructed in 2020 and 2021 adjacent to the original plant location.

Project Drivers and Needs to be Met by the Project

Project will address the high risk rating of this facility and restore the level of service, and will address mechanical equipment and structures that are in poor condition. With ever increasing environmental restrictions, it is inevitable that the aging facility experience declining performance and result in DEP permit violations. Regulatory agency input was incorporated during design phase to meet future stricter discharge parameters for the new plant.

Project Status - Describe what work, if any has been completed or underway for this project

A Condition Assessment of the WWTP was conducted in 2015 and design of the replacement facility was completed in early 2019. The project was bid the third quarter of 2019 and construction phase commenced in the fourth quarter of 2019.

Detailed Project Description

This project includes investigative and rehabilitative work to address wet weather inflow and infiltration, and is part of a DEP mandated Corrective Action Plan. Rehabilitative work includes replacement of original vitrified clay pipe (VCP) sewer main, VCP sewer lateral replacement, manhole replacement, manhole sealing, cleanout installation on laterals, and private side investigation. It is assumed that the annual construction projects will be designed, managed and bid in-house.

Project Drivers and Needs to be Met by the Project

The primary driver for this project is regulatory. The goal of this multi-year project is to eliminate DEP violations from wet weather overflows, bypasses, and treatment plant effluent limit exceedance events. Historical flows into the wastewater treatment plant have been 3 to 4 times the plant capacity during peak weather events. Mitigation of the compliance issues requires elimination of excess inflow and infiltration into the sewage collection system.

Project Status - Describe what work, if any has been completed or underway for this project

Rehabilitation of four laterals and 320 linear-feet of main were completed in 2016 utilizing internal lining technology. Updated CCTV system inspection was performed in 2017 and repair locations were determined from the data. In 2018 the replacement of 54 laterals and 1,070 linear-feet of sewer main was completed on Glen Court. In 2019 the replacement of 25 laterals and 1,100 linear feet of sewer main was completed along Heidelberg Heights Road. Rehabilitation work in 2020 and 2021 will consist of replacing the remaining sections of original vitrified clay sewer pipe and laterals (approximated 1,200 linear feet of main pipe per year). Rehabilitation work beyond 2021 will focus on installing cleanouts on all laterals, private lateral inspection and rehabilitation, and follow-up flow monitoring work.

Other		

Explanation if Necessary

Reducing excess inflow/infiltration will reduce occurrence of overflows/bypasses at the wastewater treatment plant, facilitate continued compliance with PaDEP, and save staff time and money. It is difficult to quantify potential savings with varying intensity storms and fluctuating groundwater levels.

Detailed Project Description

This is a multi-year project to provide needed upgrades at the Heidelberg Heights wastewater treatment plant. The partitioned steel equalization/sludge holding tank is part of the original plant from the 1970s and was rehabilitated in 2019. Future projects include installation of a mechanical screen at the headworks of the plant to remove rags and other inorganic material, installation of an expanded catwalk grating system above the elevated SBR tanks in order to improve maintenance access, and miscellaneous equipment upgrade/replacement.

Project Drivers and Needs to be Met by the Project

The primary project drivers are asset management and efficiency. An expanded catwalk grating system above the SBR tanks will improve maintenance access and operator safety. A mechanical screen will remove bulky inorganics and rags from the influent waste stream and thereby extend downstream pump life and reduce maintenance problems caused by accumulation of rags and debris.

Project Status - Describe what work, if any has been completed or underway for this project

Design of the 40+ year old EQ tank rehabilitation was completed early 2019 and the steel tank rehabilitation construction was completed in 2019.

Detailed Project Description

The inception of this facility expansion project pre-dates LCA's acquisition of the Lynn Township sewer system and was originally planned by the Lynn Township Sewer Authority (LTSA) in accordance with the Lynn Township Act 537 sewage facilities plan. The project involved the expansion of the WWTP capacity from 80,000 GPD to 160,000 GPD, in order to accommodate significant growth that was anticipated. Since that time the significant growth pressure has subsided, and Lynn Township was directed by DEP to update their Act 537 Plan to include current growth projections. The updated growth projection numbers in the upcoming Act 537 Plan update by Lynn Township will be used to assess the urgency and quantify the magnitude of a future expansion project. The capital plan reflects design phase only at this time.

Project Drivers and Needs to be Met by the Project

Asset management and efficiency are the primary project drivers. The WWTP expansion, as originally designed, addressed in the Township's Act 537 Plan (2007) at the time and was driven by projected growth and system inflow and infiltration (I/I) issues. Timing of the WWTP expansion construction will be dependent upon short and long term capacity needs. The purpose of this project is to update the design in accordance with updated Act 537 population growth projections, and obtain DEP permitting in event that development needs necessitate plant expansion.

Project Status - Describe what work, if any has been completed or underway for this project

Growth projections will be re-examined in 2020 as part of the Township's work to update the Act 537 Sewage Facilities Plan, to ensure the plant is properly sized. Design will begin in 2021. Construction phase timing will be a function of development pressure and contingent upon developer capacity charges.

Detailed Project Description

This project is part of a DEP mandated Corrective Action Plan, and is intended to mitigate inflow and infiltration into the collection system during and after peak weather events and eliminate system overflows and treatment plant bypasses. Updated internal CCTV inspection of the sewage collection system and inspection of manholes were performed in 2019 and the data was used to identify and target and repair locations in the Lynn Township sewage collection system. Capital rehabilitation projects are planned starting in 2020 and include a comprehensive manhole rehabilitation, collection system repairs, and investigation and enforcement of illegal connections on the private side.

Project Drivers and Needs to be Met by the Project

The primary project driver is regulatory, as the work is part of the DEP-mandated Corrective Action Plan to reduce occurrence and magnitude of wet weather peak flows at the WWTP that cause hydraulic overloads. The purpose of the project is to mitigate extraneous flow into the system, maintain DEP compliance, and obtain additional sewer allocations for growth within Township sewer service area.

Project Status - Describe what work, if any has been completed or underway for this project

In 2017 a flow meter study was conducted throughout the system providing data on the areas contributing to excess wet weather flows. In 2018 a manhole inspection program was developed and implemented, along with smoke testing at the campus of the Northwestern Lehigh School District. In 2019 repairs to the on-site sanitary sewer system were performed by the school district, and LCA performed numerous collection system spot repairs to abate significant system leaks. In 2019 an updated internal CCTV inspection of the entire sewage collection system was performed, along with easement stabilization. A capital project is planned for 2020 will focus on manhole rehabilitation, and subsequent projects will further address inflow and infiltration by concentrating on private side work, including lateral inspection/rehabilitation.

Annual Cost Impact

Term (Years)	30

Revenue Impact	
Gain/(Loss) in Annual Revenue	N/A
Assessment, Contribution	N/A
in Aid-of-Construction	N/A
Other	

Explanation if Necessary

Reducing I/I flow should result in a reduction of treatment plant operating costs by reducing volume of wastewater that must be conveyed through the plant processes. It is difficult to quantify amount of extraneous flow to be removed, and therefore quantifying cost savings is difficult. Exact costs to be determined.

^{**=} The Park Pump Station provides service to 7 WLI signatories and 3 of the City signatories.

Detailed Project Description

The primary driver for this project is asset management. This project will address the internal rehabilitation of a yet to be identified quantity of existing Park Pump Station Force Main. An internal inspection of the pipe will be performed in 2020 to identify the level of risk and extent of rehabilitation required, and will be used to develop the scope of rehabilitation construction (to be performed in 2021 and 2022). The internal inspection will involve a person entering the drained and ventilated force main from five air release valve access locations, and performing a limited representative visual inspection. For this Capital Plan, rehabilitation work is assumed to consist of internal pipe lining of critical sections.

Project Drivers and Needs to be Met by the Project

The Prestressed Concrete Cylinder Pipe (PCCP) force main pipe was installed in ~1980. This type of pipe is particularly subject to deterioration because corrosive Hydrogen Sulfide gas generated by the wastewater is converted to sulfuric acid (which degrades concrete and any exposed reinforcing steel cylinder pipe) thereby impacting the structural integrity of the pipe. Rehabilitation of the force main will restore level of service, assure longevity and mitigate the risk of a catastrophic failure.

Note: PCCP consists of a concrete core, a thin steel cylinder, high tensile prestressing wires and a mortar coating. Structural deterioration occurs from sulfuric acid acting on exposed steel reinforcing.

Project Status - Describe what work, if any has been completed or underway for this project

An internal inspection of the force main will be conducted in 2020 and the scope of rehabilitation work will be determined.

Note: Utilization of the funding shown in this Capital Plan is contingent upon risk rating of the existing pipe (based on condition, probability of failure and consequence of failure factors).

^{**=} The Park Pump Station provides service to 7 WLI signatories and 3 of City signatories.

Detailed Project Description

Improvements to the pump station include replacement of the existing pumps, suction and discharge side valves, pump speed controllers, motor control center (MCC) panel, SCADA system, wet well level instrumentation, building roof and force main drain valve. Also included are miscellaneous structural, HVAC and other improvements as outlined in Option 3 of the March 21, 2016 Park Pump Station Evaluation Technical Memorandum prepared by Arcadis. Construction will be completed on the above improvements by early 2020. The upcoming phase of the station upgrade is to consist of replacement of the original backup diesel generator, which is nearing the end of its service life.

Project Drivers and Needs to be Met by the Project

Asset management is the primary driver for this project. Park Pump Station is a critical component of the sewerage infrastructure network in the region, serving ten municipalities. Its operation is critical to conveying wet weather flows and normal day flows, and significantly impacts the operation of Allentown's wastewater treatment plant at Kline's Island. Many mechanical components are nearing the end of their service life with negative impacts to station performance and reliability. The improvements are needed to restore the station to its design capacity, maintain level of service and extend service life into the foreseeable future. This project is part of the work necessary to comply with the submitted RFMS.

Project Status - Describe what work, if any has been completed or underway for this project

An Evaluation Technical Memorandum was prepared by Arcadis which assessed various options for continued operation of the pump station. The recommendations outlined in Option 3 of the Memorandum were selected to improve the reliability and capacity of the pump station through 2025. The upgrade design was completed in late 2017, the project was bid in early 2018, construction phase commenced in mid-2018 and the project will be completed the first quarter of 2019. Design of the replacement diesel generator is to be performed in 2021, with construction anticipated to be completed by the end of 2023.

Explanation if Necessary

The installation of higher efficiency pumps and motors with variable frequency drive control (VFDs) as part of this project should result in an electrical power savings, however at this time the amount is unknown. Exact costs to be determined. A new generator will insure station operation reliability and enhance resiliency in event of a catastrophic event that results in an extended period of electrical power outage.

Is this System part of a Common User Rate?	N/A	Anticipated Project completion date	TBD		
Will the Project Require Obtaining Land Rights	No	Anticipated Project completion date			

^{**=} The Park Pump Station provides service to 7 WLI signatories and 3 of City signatories.

Detailed Project Description

The 2016 draft Act 537 Plan identified future wastewater capacity needs for the Western Lehigh Interceptor. Subsequent studies and flow models performed by Arcadis have determined that a conveyance capacity of 45 million gallons per day (mgd) is required at the Park Pump Station within the next 20 years. The recommended alternative for providing this capacity is the construction of a "Sister Pump Station" next to the existing Park Pump Station, with a design capacity of approximately 25 mgd.

Project Drivers and Needs to be Met by the Project

The primary drivers for the project are regulatory and system capacity/new customers. This project will provide future conveyance capacity as determined from prior studies and hydraulic models of the Western Lehigh Interceptor and mitigate sanitary sewer overflows.

Project Status - Describe what work, if any has been completed or underway for this project

This concept was discussed as part of preliminary planning for future wastewater capacity needs. A force main alignment study will be performed in 2025 as part of a feasibility study, which should be completed by 2026 (following completion of Act 537 planning). Design phase is anticipated to begin following review of the feasibility study and incorporation of Act 537 planning impacts.

Provides service to 7 WLI signatories, the Borough of Emmaus & others.

Detailed Project Description

LCA provides the leadership, technical expertise and administration for coordinating the projects located within the Signatory sewer systems. The project included two major components: (1) Investigatory/planning work such as flow monitoring, the SCARP development, SSES, Level of Service Determination, Alternatives Analysis, etc., that are necessary to develop the best course of action to reduce I&I within the system(s). Much of this (1) work has been completed. Part (2) - Design, permitting and the construction for rehabilitation of infrastructure that will be necessary to comply with recent PA DEP directives - has not been completed yet.

Project Drivers and Needs to be Met by the Project

All SSES work, flow monitoring and preliminary modeling work has been completed to define the characteristics of the sewer basins and identify the leakiest basins. With the recent shift from the AO being lifted to full Act 537 Planning, efforts have been realigned. Recalibration of the model is expected in Q2 2020 with new flow metering data. The model will help in determining the effectiveness of the source removal work completed to date and design of the Trexlertown Interceptor Project. Risk of not doing this project include regulatory action against the region.

Project Status - Describe what work, if any has been completed or underway for this project

Investigation and preliminary alternatives analysis work was completed by 2016. Flow monitoring and analysis occurred in 2017 and 2019. The WLI model recalibration will be completed in 2020. Additional items for 2020 include a MH/end seal project and a new flow monitoring assignment for the WLSP. MH and end seal projects will continue in 2021 and 2022 as well.

^{**=}The WLI system provides service to 7 WLI signatories.

Detailed Project Description

As part of the Western Lehigh Interceptor SCARP program, a conveyance capacity bottleneck was identified in the Trexlertown area, and this was assigned a high priority due to the occurrence of sanitary sewer overflows in the vicinity. A parallel interceptor was originally conceived to run between Cetronia Rd south to Spring Creek Rd. The concept was modified to focus on providing wet weather storage capacity, due to concerns about downstream hydraulic impacts. The project is an interim solution to address wet weather capacity issues, and will become part of a future long-term solution to alleviate regional sewage conveyance capacity challenges.

Project Drivers and Needs to be Met by the Project

The primary drivers for the project are regulatory and system improvement. Additional wet weather wastewater storage and conveyance capacity is required in the segment of the WLI Interceptor. This project is intended to address short term wet weather flows, eliminate long range dry-day overflows, and allow for future growth.

Project Status - Describe what work, if any has been completed or underway for this project

Hydraulic modeling and conceptual cost estimates for the interceptor option were executed as part of the Signatory I&I project. Preliminary cost estimates for this project (interceptor option) and for the Iron Run pump station and force main (as an alternative option) were completed in 2018. A pre-design feasibility study commenced in late 2019 and is to be completed in the second quarter of 2020. Design phase will begin in late 2020.
